

Elicit, analyse, deliver — without losing the audit trail.

Every insight from every meeting is captured, BABOK-tagged, and traceable to a signed requirement. Your evidence writes itself while you focus on the conversation.

TRACEABILITY

Why BAs are calling it “unreasonably fast”

Four pieces of the workflow that don't exist in your current toolchain.

Recall.ai capture

Zoom, Teams, Meet and in-person sessions transcribed live with speaker attribution and searchable timestamps.

MODULE 01

Insights → Requirements

Every insight is one click from a categorised, prioritised, BABOK-tagged requirement with source utterance attached.

MODULE 02

21 BABOK diagrams

Process, use-case, data flow, state, journey and 16 more — auto-generated from transcripts, refined in-editor.

MODULE 03

Bidirectional RTM

Requirement ↔ risk ↔ test ↔ change linked automatically and rendered on demand as coverage heatmap or matrix.

MODULE 04

Four ways to work the same requirement

One canvas, many lanes. Switch between them without losing evidence or approvals.

ELICIT FROM MEETINGS

Live capture

Insights land in your workspace as the meeting runs. Tag, promote and route without opening a second tool.

e.g. Turn a stakeholder aside into a signed URS clause before the call ends.

AUTHOR FROM DOCS

Document mining

Drop in an SOP, RFP or legacy spec. Parser extracts candidate reqs with page-cited evidence.

e.g. 180-page RFP → 274 draft requirements in under 4 minutes.

MODEL FIRST

Diagram-driven

Draw the process, generate the requirements. Every shape carries the requirement it implements.

e.g. Swimlane change → impacted reqs flagged automatically.

OR MIX ALL THREE

Hybrid workflow

Anchor on a captured insight, add a mined requirement, refine on the diagram. Provenance carries.

e.g. Meeting quote + SOP clause + process step → one signed requirement.

Seven lifecycle phases, six signed gates

You own gates 2–5 — Charter, URS, Design, TSR.
